

Delivery Assurance Program

Successfully deploy Dell Boomi AtomSphere with our Delivery Assurance Program (DAP). DAP ensures your organization receives the appropriate architecture and process guidance at critical stages of your AtomSphere implementation.

DAP is delivered by our services team, which has significant AtomSphere experience across a multitude of integration patterns, integrating a wide variety of endpoint technologies. They've developed the best approaches to avoid pre- or post-deployment issues, and they'll ensure your integration processes are created to allow for scalability into the future.

How you'll benefit

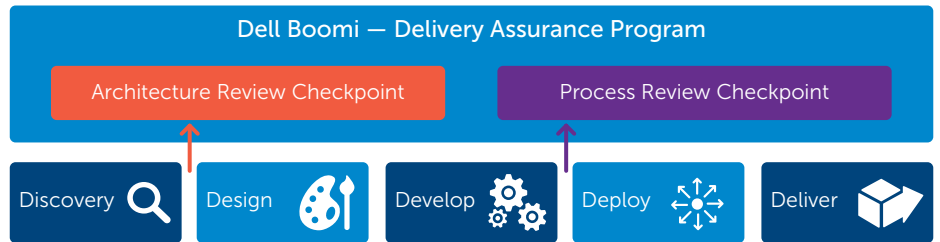

DAP focuses on ensuring ultimate customer success, so you can realize faster time to value.

This program will help you:

- Implement AtomSphere according to best practices, based on your implementation objectives.
- Gain access to an elite team of integration professionals across Dell Boomi's Technical Architecture and Consulting teams.
- Develop skills so in-house expertise can deliver more robust solutions based on repeatable approaches.
- Increase awareness of the latest product features and enhancements.
- Identify opportunities to expand your use of Dell Boomi to maximize your technology investment.

How it works

Dell Boomi's DAP includes architecture and process reviews, as well as access to our professional services experts, who review and provide guidance to ensure your implementation is successful. There are two key stages where Dell Boomi's DAP is activated: the Architecture Review Checkpoint and the Process Review Checkpoint.

Architecture Review Checkpoint

Occurring between the Discovery and Design phases, the Architecture Review Checkpoint involves reviewing and advising your team on:

- Integration scope
 - Endpoints and connectivity analysis
 - Frequency, scheduling, triggers
 - Number of transactions, records and document size
 - Business logic
- Runtime analysis
 - Cloud vs. local
 - Atom vs. Molecule
- Governance
 - Testing strategies
 - Environment setup
- Error handling
- Account management
 - User access
 - License management
- Integration maintenance

Process Review Checkpoint

Occurring between the Develop and Deploy phases, the Process Review Checkpoint provides assessment of and direction for:

- Process performance
- Process scalability
- Usability/maintenance
- Testing
 - Load testing
 - Runtime testing
- Adherence to best practices
 - Error handling
 - Field-level tracking
 - Extensions
 - Naming conventions
 - Component management
 - Environment
